

ITT MK-880

Universal Modular Night Vision Pocketscope

Compact, high-performance, versatile night vision system (ITT). In the standard configuration it is a handheld night vision pocketscope with 27mm ocular and 27mm objective lenses (providing 1x system magnification). The user can also select from among several different lenses and adapters to reconfigure the system to suit a particular application. The pocketscope is available with Generation II, SuperGen, or Generation III Image Intensification.

The unique design provides an exceptional degree of flexibility. The pocketscope can be used as a surveillance device for low-level photography or, when attached to a head mount accessory, as a hands-free

system for covert operations. It can also be converted into a night vision weapon sight.

Unlike other pocketscopes, the design permits the use of simple adapters to couple the system to any refractive or catadioptric objective lens, of any focal length, that may be desirable for a particular application.

Features:

- Accepts any objective lens
- Can be used for direct viewing or coupled to SLR cameras, CCTV cameras or camcorders
- High-performance 18mm Gen2 or Gen3 Image Intensifier
- Hand-held, hands-free, or tripod mountable
